Mammal refers to human or animals.

The compounds of the present invention are generally named according to the IUPAC or CAS nomenclature system. Abbreviations which are well known to one of ordinary skill in the art may be used (e.g. "Ph" for phenyl, "Me" for methyl, "Et" for ethyl, "O" for oxygen atom, "S" for sulfur atom, "N" for nitrogen atom, "h" for hour or hours and "rt" for room temperature).

The compounds of the present invention can be converted to their salts, where appropriate, according to conventional methods.

The term "pharmaceutically acceptable salts" refers to acid addition salts useful for administering the compounds of this invention and include hydrochloride, 5 hydrobromide, hydroiodide, sulfate, phosphate, acetate, propionate, lactate, mesylate, maleate, malate, succinate, tartrate, citric acid, 2-hydroxyethyl sulfonate, fumarate and the like. These salts may be in hydrated form.

The compounds of Formula I of this invention contain a chiral center, such as at C-5 of the isoxazoline ring, and as such there exist two enantiomers or a racemic 10 mixture of both. This invention relates to both the enantiomers, as well as mixtures containing both the isomers. In addition, depending on substituents, additional chiral centers and other isomeric forms may be present in compounds of formula I, and this invention embraces all possible stereoisomers and geometric forms.

The compounds of this invention are useful for treatment of microbial 15 infections in humans and other warm blooded animals, under both parenteral and oral administration.

The pharmaceutical compositions of this invention may be prepared by combining the compounds of this invention with a solid or liquid pharmaceutically acceptable carrier and, optionally, with pharmaceutically acceptable adjuvants and 20 excipients employing standard and conventional techniques. Solid form compositions include powders, tablets, dispersible granules, capsules, cachets and suppositories. A solid carrier can be at least one substance which may also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, 25 magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol systems, optionally containing suitable conventional coloring agents, flavoring 30 agents, stabilizers and thickening agents.

Preferably, the pharmaceutical composition is provided employing conventional techniques in unit dosage form containing effective or appropriate amounts of the active component, that is, the compound according to this invention.

The quantity of active component, that is the compound according to this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application, the potency of the particular compound and the desired concentration. Generally, the quantity of active 5 component will range between 0.5% to 90% by weight of the composition.

In therapeutic use for treating, or combatting, bacterial infections in warm-blooded animals, the compounds or pharmaceutical compositions thereof will be administered orally, parenterally and/or topically at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the animal 10 undergoing treatment which will be antibacterially effective. Generally, such antibacterially effective amount of dosage of active component will be in the range of about 0.1 to about 100, more preferably about 3.0 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of the bacterial infection being treated, and the particular 15 compound being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses 20 for administration, e.g., 2-4 four times per day.

The compounds according to this invention may be administered parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration. Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compound or a soluble 25 salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a buffer to provide a suitably buffered isotonic solution, for example, having a pH of about 3.5-6. Suitable buffering agents include, for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine to name but a few 30 representative buffering agents. The compound of this invention generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/mL to about 400 mg/mL of solution. The resulting liquid pharmaceutical composition will be

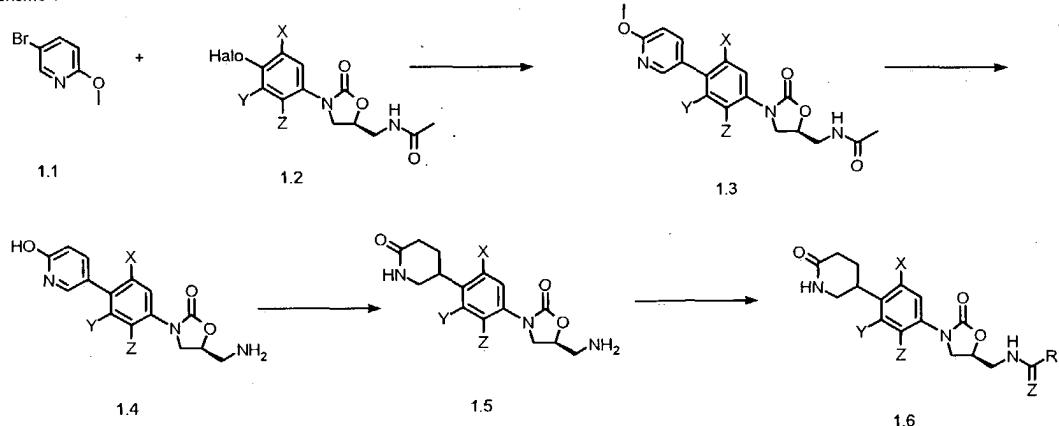

administered so as to obtain the above-mentioned antibacterially effective amount of dosage. The compounds according to this invention are advantageously administered orally in solid and liquid dosage forms.

As a topical treatment an effective amount of Formula I is admixed in a pharmaceutically acceptable gel or cream vehicle that can be applied to the patient's skin at the area of treatment. Preparation of such creams and gels is well known in the art and can include penetration enhancers.

The oxazolidinone antibacterial agents of this invention have useful activity against a variety of organisms. The in vitro activity of compounds of this invention can be assessed by standard testing procedures such as the determination of minimum inhibitory concentration (MIC) by agar dilution as described in "Approved Standard. Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically", 3rd. ed., published 1993 by the National Committee for Clinical Laboratory Standards, Villanova, Pennsylvania, USA.

Compounds of formula I may be produced by methods known to those skilled in the art. For instance the compounds of formula I may be synthesized via schemes 1-4 shown below.

Scheme 1

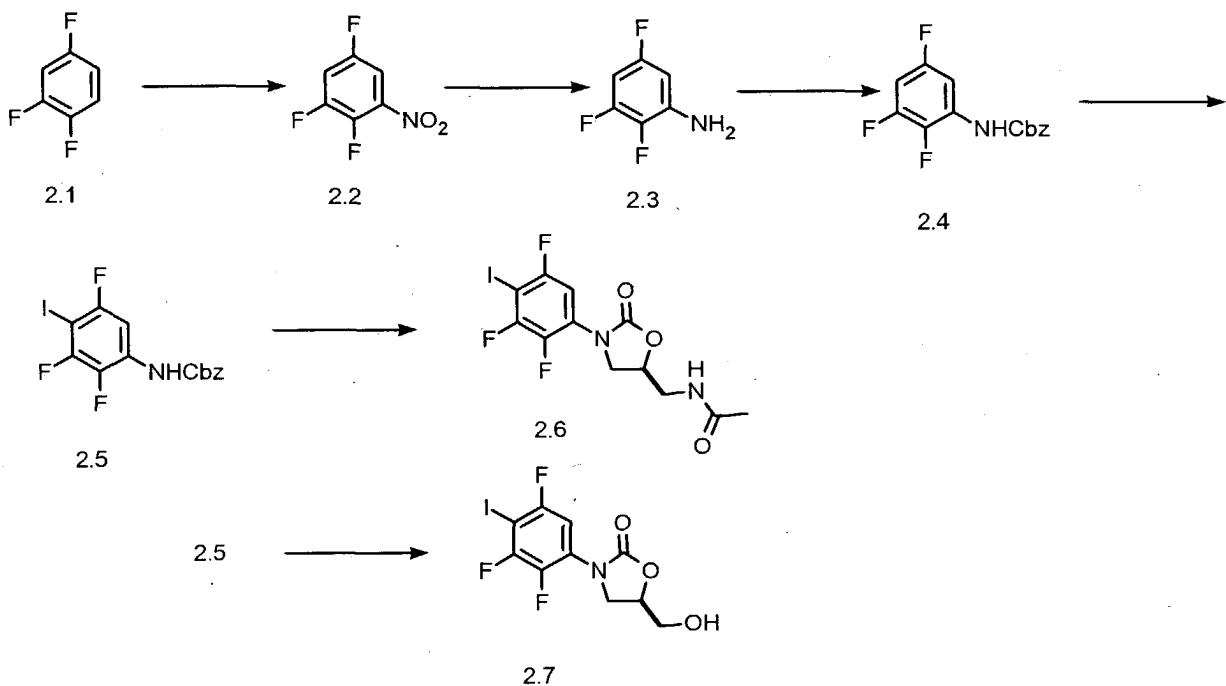

Referring to scheme 1, a functionalized pyridine **1.1** including an alkoxy moiety is coupled via a Suzuki type coupling to an N-phenyl-2-oxazolidinone-5-carboxamide **1.2** to form an alkoxy substituted pyridyl-4-phenyl-2-oxazolidinone-5-methyl amide **1.3**. Acidic cleavage of the alkoxy substituent with HCl / dioxane provides the hydroxypyridine **1.4**. Hydrogenation of the alcohol substituted pyridyl-4-phenyl-2-oxazolidinone-5-methyl amine **1.4** affords the N-phenyl-2-oxazolidinone-5-methyl amine lactam **1.5** and acylation of the oxazolidinone C-5 methyl amine provides the desired lactam **1.6**. Although scheme 1 illustrates a synthesis for

preparing *N*-(*(5S*)-3-[4-(6-oxopiperidin-3-yl)phenyl]-2-oxo-1,3-oxazolidin-5-yl} methyl) derivatives, *N*-(*(5S*)-3-[4-(2-oxopiperidin-4-yl)phenyl]-2-oxo-1,3-oxazolidin-5-yl} methyl) derivatives may be synthesized by utilizing the appropriate pyridine starting material.

Scheme 2, 10 shown below, describes a procedure for producing starting materials in which the phenyl substituents are  $X=Y=Z=F$ .

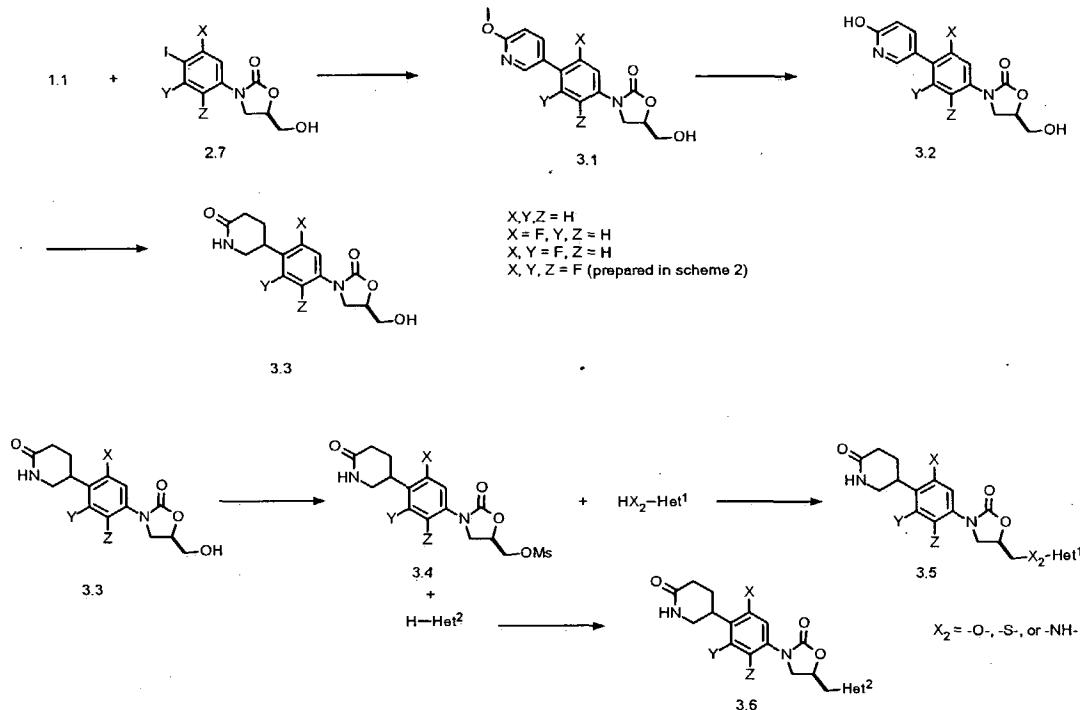

Scheme 2

15        Referring to scheme 2, trifluorobenzene **2.1** is nitrated to provide 2,3,5-trifluoronitrobenzene **2.2**. After reduction to the difluoroaniline **2.3**, the amine is protected to afford **2.4** and then halogenated to provide **2.5**. The substituted *N*-phenyl-oxazolidinone-5-methyl amide **2.6** may be produced from the protected aniline **2.5** using known methods, such as, described in **Case 393**, which are hereby incorporated by reference. The protected aniline alternatively can be converted to the alcohol **2.7** by methods described in *J. Med. Chem.* **1996**, *39*, 673. Hydrolysis and

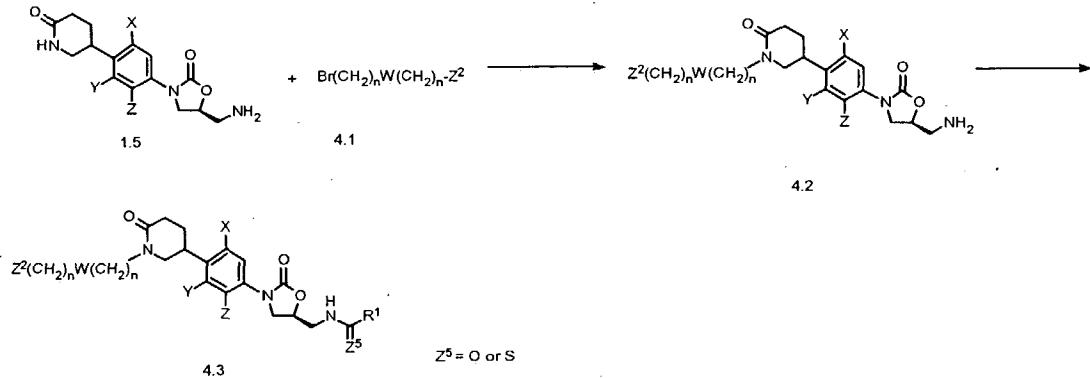

reduction of the methyl amide provides the N-phenyl-oxazolidinone-5-methyl alcohol **2.7**.

Scheme 3

Referring scheme 3, N-phenyl-oxazolidinone-5-methyl alcohol **2.7** may be  
 5 coupled to pyridine **1.1** via a Suzuki type coupling to afford **3.1** Hydrolysis of **3.1** in  
 HCl / Dioxane affords hydroxypyridine **3.2**. Reduction of the hydroxypyridine with  
 palladium affords lactam alcohol **3.3**. Reaction of alcohol **3.3** with mesyl chloride in  
 triethylamine affords the oxopiperidinyl-phenyl-oxazolidinone-5-methylmesylate **3.4**.  
 Reaction of the mesylate **3.4** with  $\text{HX}_2\text{-Het}^1$  or  $\text{H-Het}^2$  provides the compounds **3.5**  
 10 and **3.6**, respectively, of formula I.

In some embodiments, the antibacterial compounds are prodrugs of the compounds of formula I. The expression "prodrug" denotes a derivative of a known direct acting drug, which is transformed into the active drug by an enzymatic or chemical process. Prodrugs of the compounds of formula I are prepared by modifying 25 functional groups present on the compound in such a way that the modifications are cleaved, either in routine manipulation or in vivo, to the parent compound. Prodrugs include, but are not limited to, compounds of structure (I) wherein hydroxy, amine or sulphydryl groups are bonded to any group that, when administered to the animal, cleaves to form the free hydroxyl, amino or sulphydryl group, respectively. 30 Representative examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups. Example 27:

25 MIC Test Method

The *in vitro* MICs of test compounds were determined by a standard agar dilution method. A stock drug solution of each analog was prepared in the preferred solvent, usually DMSO:H<sub>2</sub>O (1:3). Serial 2-fold dilutions of each sample are made using 1.0 ml aliquots of sterile distilled water. To each 1.0 ml aliquot of drug was

added 9 ml of molten Mueller Hinton agar medium. The drug-supplemented agar was mixed, poured into 15 x 100 mm petri dishes, and allowed to solidify and dry prior to inoculation.

Vials of each of the test organisms are maintained frozen in the vapor phase of a liquid nitrogen freezer. Test cultures are grown overnight at 35°C on the medium appropriate for the organism. Colonies are harvested with a sterile swab, and cell suspensions are prepared in Trypticase Soy broth (TSB) to equal the turbidity of a 0.5 McFarland standard. A 1:20 dilution of each suspension was made in TSB. The plates containing the drug supplemented agar are inoculated with a 0.001 ml drop of the cell suspension using a Steers replicator, yielding approximately  $10^4$  to  $10^5$  cells per spot. The plates are incubated overnight at 35°C.

Following incubation the Minimum Inhibitory Concentration (MIC  $\mu\text{g}/\text{ml}$ ), the lowest concentration of drug that inhibits visible growth of the organism, was read and recorded. The data is shown in Table I.
